WHAT IS EPILEPSY?

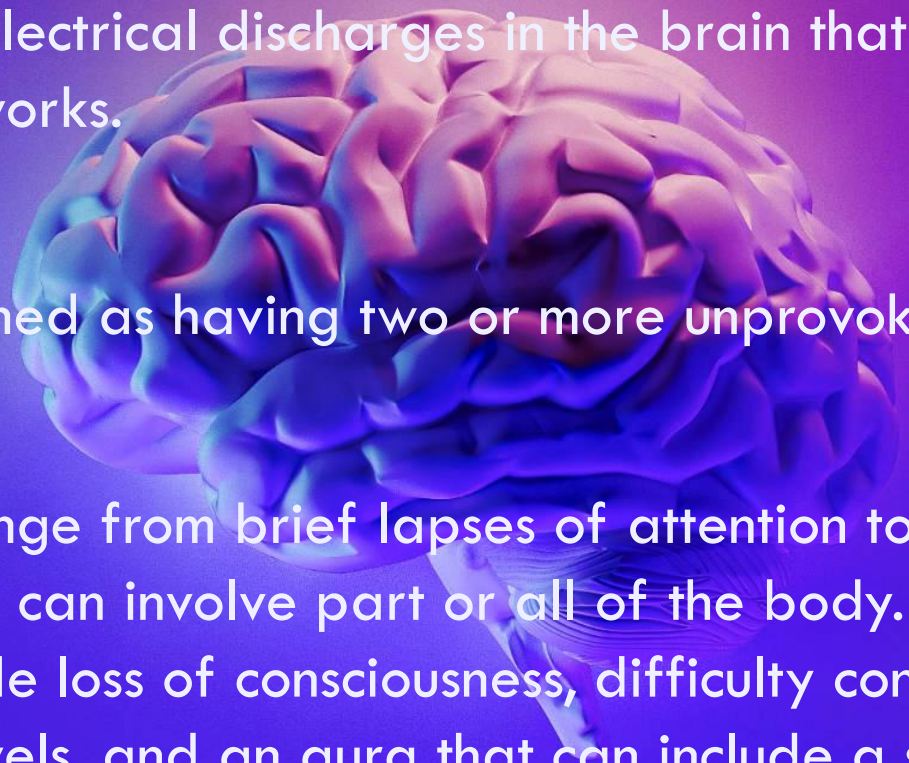
Epilepsy is a chronic brain disease that causes seizures, which are abnormal electrical discharges in the brain that can impact how the brain works.

Definition:

Epilepsy is defined as having two or more unprovoked seizures.

Symptoms:

Seizures can range from brief lapses of attention to severe convulsions, and can involve part or all of the body. Other symptoms include loss of consciousness, difficulty controlling the bladder or bowels, and an aura that can include a sudden emotion, smell, taste, or feeling of déjà vu.



WHAT IS THIS PRESENTATION ABOUT?

- A review of 2 client cases that I have worked with in my practice, both of which have presented with a medical diagnosis of Epilepsy.
- A contrasting review, looking at each clients presenting symptoms and analysis of the scope of the factors involved in each case.
- This is a limited experiential review, I am by no means an expert on the topic of Epilepsy.

CLIENT PRESENTATION

CLIENT A

- 28 year old female.
- Regular seizures following accident when hit by car aged 18. Diagnosed aged 26 as epilepsy.
- Had seizures regularly after food.
- Diagnosed with brain damage to left temporal lobe following horse riding accident aged 12.
- Regular skin breakouts - acne.

CLIENT B

- 22 year old female.
- Seizures started following HPV vaccine aged 16.
- Hot flushes and seizures, usually around menstruation.
- Constant nausea
- Irregular sleeping patterns.
- Regularly twitching, full body tremors, painful clicking in neck and spine.
- Bladder frequency issues.

CLIENT A – 4 IN PERSON SESSIONS IN TOTAL OVER 6 WEEK PERIOD

- Cerebellum – Attack conflict in 1st session – Car impact aged 18.
- Brain relays involved - Left pericardium, Skin LHS body and face
- Emotion of feeling startled.
- Chromosomes of metabolism and rheostasis.
- Rebalance of brain including cerebellum and left temporal lobe.
- 80% increase in new neurons required.
- No seizures following 1st session.
- Respiratory condition scan in next session, with air conflict trauma, vaccine protocol, hormonal balancing, microbes etc. in subsequent sessions.

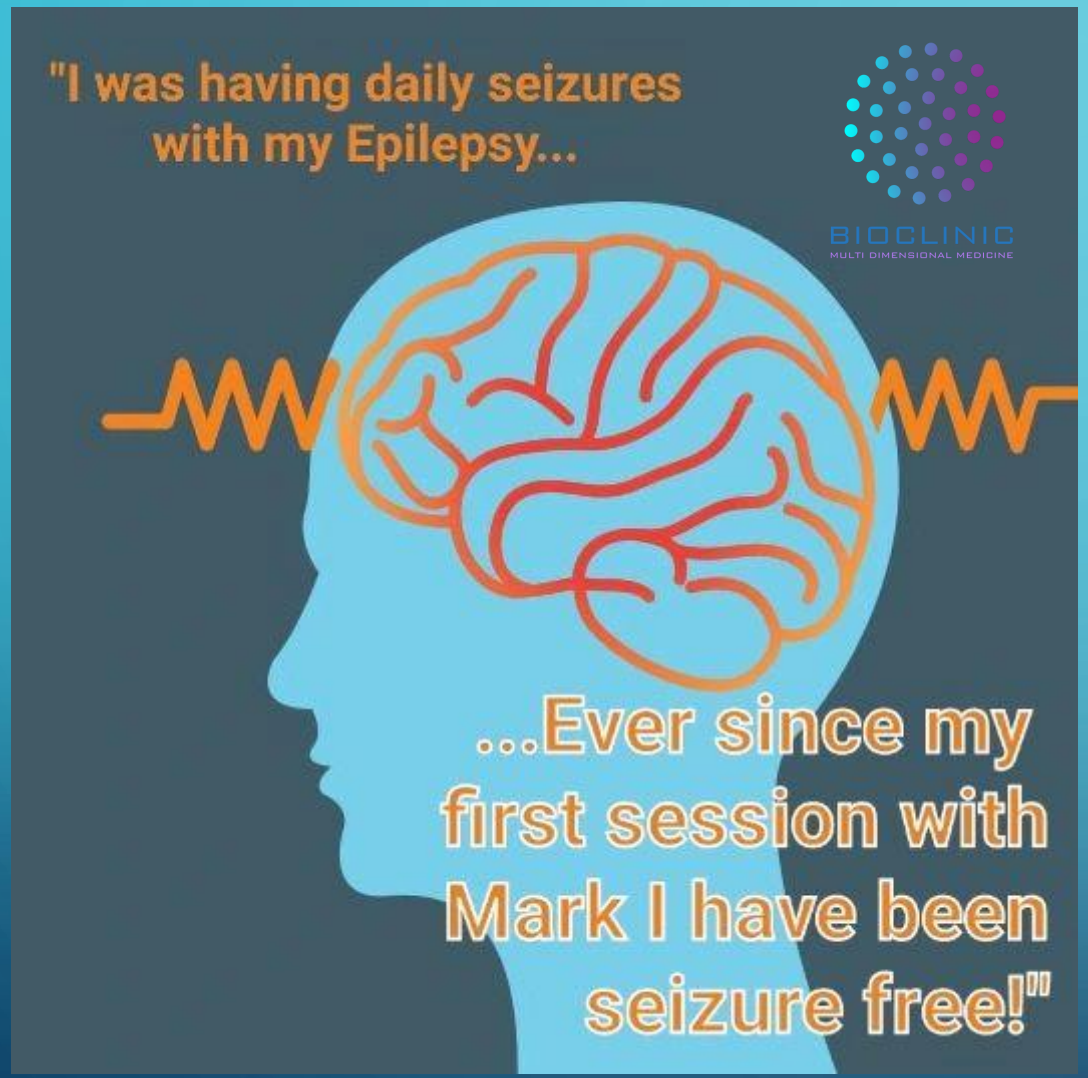
CLIENT TESTIMONIAL

“I went to see Mark as I was having daily seizures with my Epilepsy and was very interested in the holistic approach to my health. Ever since my first session with Mark I have been seizure free making it 45 days in total, this being my longest streak in over two years! …”

March 2022

Client remains seizure free and is now back driving, fully independent and thriving.

I CAN CURE EPILEPSY?



Instagram post March 22

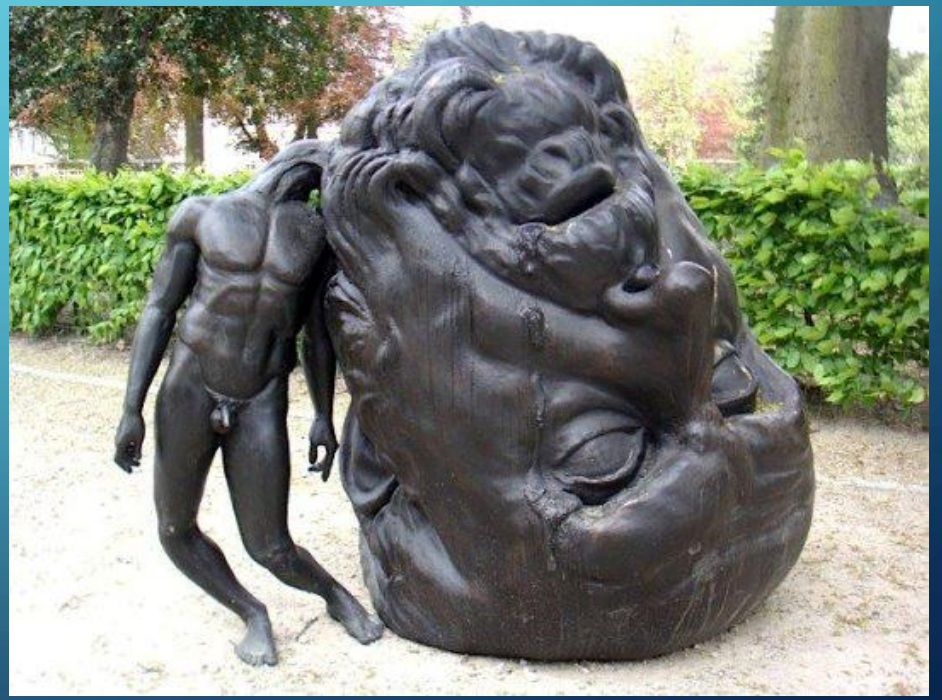
Phonecall received in response to Instagram post from mother of client B



"THIS SHOULD BE EASY!"

CLIENT B – 30+ REMOTE SESSIONS OVER 18 MONTH PERIOD

- Multiple cerebellum – Attack conflict traumas – Including 3 absorbed during gestation - Relays to right and left pericardium, right pleura and peritoneum, skin, breast glands.
- Multiple cerebral cortex - Territorial traumas – Relays to bronchial muscles, larynx, myocardium, bladder & ureter mucosa, stomach, bile ducts, pancreatic ducts, ovaries, visual cortex, beta-islet cells
- Brainstem - Air conflict trauma + food metabolism trauma – Relays to aveoli of lungs, caecum, appendix, ascending colon, transverse colon, rectum mucosa, colon mucosa, bladder mucosa, acoustic nerves
- Thalamus conflict – Self abandonment – I wish I was dead. Soul incorporation issue.

SENSATIONS & EMOTIONS

- Child terror
- Anxiety
- Frightened
- Unprotected
- Threatened
- Unable to defend myself
- Severe missing of a person
- Not being able to follow someone
- Profound sadness
- Unable to speak or express
- Unable to establish inner boundaries
- Unable to mark territory
- Resistance to sweetness of life
- Unfairness
- Unloved
- Defeated.

FACTORS INVOLVED

- While the HPV vaccination seems to have triggered the onset of the seizures, the issue appears to have been more deep rooted than vaccine intoxication.
- Client grew up in what felt like an unsafe environment with continuous exposure to violence and aggression.
- Aunt (described as being “like a sister”) moved to Australia around time of onset of seizures.
- Soul disconnect – incorporation issue. Client had also fallen out with friends 2 years prior to beginning of treatments, conveyed feeling disconnected from life.
- Deep-rooted entanglements with mother, sleeping in same bed, unable to separate from each others anxiety.
- Traumas were constantly getting retriggered in home environment. Assured violence and aggression no longer prevalent, but any argument between parents retriggered violent twitches/seizures.
- Traumas also getting triggered in outer environment by memories of feeling unprotected or unsafe.
- Intergenerational aspects – referred to Raymond to work on some of the deeper ancestral entanglements.

INTERVENTIONS AND APPROACH TO HEALING

- Family approach - working with brother and both parents individually, to release the traumas from the family growing up in such a hostile environment.
- Strict agreement with parents for no more aggression or violence in the house.
- Working to grow clients confidence in gaining her independence, opening to the joy of life.
- Gently working with both client and mother to establish boundaries in relationship, nudging towards the benefits for both in making moves towards regaining their independence.
- Taking a more targeted approach in relation to other modalities and interventions; try not to overload the client, testing supplements and remedies etc in sessions to determine what was beneficial and what was neutral or harmful.
- Working to dissolve the strong identification with HPV vaccine damage.

CURRENT SITUATION

- Client has had 4 relapses, full seizures, since beginning treatment - last one was 4 months ago.
- Each seizure was triggered by a memory associated with traumas, which we worked on immediately subsequent to each incident.
- Full body twitches and involuntary movements have substantially subsided, still triggered occasionally.
- 2 weeks ago, client slept on her own for 1st time in over 2 years.
- This weekend, client moved out of home to begin a University Masters Degree.
- Family report a more harmonious and joyful family dynamic since beginning treatments.

CLIENT TESTIMONIAL

"Since starting treatment I've found my self more at ease and being able to live my life each day at a time. Before I was constantly twitching and having tremors with heightened anxiety and OCD. As time went on I saw all of these symptoms decrease. I no longer meticulously plan my days and have anxiety attacks when something deviates or cancels last minute, I'm able to go out freely and enjoy my time and live in the moment and appreciate what I'm doing. I've been able to go back to university and drive again and I can even see a higher level of confidence in my self where I'm able to be independent and not rely on others and can even make new friends.

I've loved having the treatments and being able to lie down and relax was the icing on the cake."

EXCITED FOR NEW BEGINNINGS, FULL OF THE JOYS OF LIFE!

MAYBE…

JOY CAN CURE "EPILEPSY"?

LEARNING OUTCOMES

- While both clients presented with a medical diagnosis of epilepsy, it is clear from a review of the case history of each that there were vastly different underlying causes.
- Single (possibly double) impact trauma resulting in abnormal electrical discharges to the brain in the case of Client A.
- Once trauma was released and brain was balanced, healing was immediate.
- Multiple traumas in the case of Client B, along with a soul disconnect.
- A long ongoing process of regaining independence, confidence and joy in life is required to overcome the somatic memories of a traumatic childhood. These traumatic memories appear to be the prevalent cause of abnormal electrical discharges for the client in this case.
